

Wood Plastic Composite (WPC) Traction Sealer

As per AS/NZS 4586-2013

WPC Traction Sealer is a waterborne protective coating designed for use over first generation Wood Plastic Composite substrates to add a slip resistant medium for slip protection.

- **Product:** WPC Traction Sealer
- **Product Code:** CTWT-XXX (Three figure suffix denoting Gloss level and size)
- **Standard Colour:** Clear
- **Gloss level:** Matt
- **Application Tools:** 10 to 12 napp Micro Fibre or Mohair roller or brush
- **Spread Rate:** Up to 20m² per Litre depending on applicator used.
- **Thinning/clean up:** No thinning required, clean up with water.
- **Drying Time:** 20-30 minutes touch dry at ambient temperature of 25° C with good ventilation. (Note drying times will be slower in cold damp conditions or if applied in high humidity)
- **Recoat Time:** 1-2 hrs
- **Exterior Exposure:** 12-18 mths (provided surface is maintained periodically with Composite Clean)
- **Container Size:** 4lt, 10lt
- **Shelf Life:** 12 months in original un-opened package
- **Flash Point:** Non-Flammable

Uses: **WPC Traction Sealer** has been designed to impart the natural look on wood plastic composite substrates mixed with fine Polyester Grit for slip resistance. It is designed to provide a full slip resistance P4 rating as per AS/NZS 4586-2013, and with the addition of our Medium Grit will give a full P5 rating as a wet surface pendulum test. **WPC Traction Sealer** is quick and easy to use and can be used as a Sealer to protect the Composite surface or as part of the full protection/restoration process with the **WPC Refresh**.

SURFACE PREPARATION

- **Do not apply WPC Traction Sealer below 10°C or above 25°C, a hot surface will cause the product to flash off too fast. This will create surface defects as lap marks, to prevent this from happening, apply either very early in the morning or later in shade, under cover or coat prior to installation. (Generally if the surface is too hot to walk on bare foot, do not seal.) Alternatively Temperatures below 10°C will greatly slow down the curing process and may lead to film defects.**
- **Do not apply with relative humidity above 85% or if rain is imminent, this may affect the curing process and may cause drying problems and overall product performance.**
- **Substrate must be dry. Do not apply on wet or damp surface.**
- **Avoid application in direct sunlight. (to avoid blotchy uneven look, apply over small sections (three full lengths at a time). Apply by brush or roller (Micro Fibre, Mohair) WPC Traction Sealer evenly, do not allow to pool on the surface)**
- **Do not apply over existing solvent or water based oils/coatings other than Deck Protect products, strip old coatings using Deck Protect Strip refer technical data for instructions.**

- Not recommended for use on polymer capped 2nd generation composites.

New Wood Plastic Composite

Cleaning Procedure

Brushed side / Smooth side

1. Prepare all Composite Wood surfaces by applying **Composite Clean** treatment solution as per mixing rate of 12:1 as shown on the label. Apply at this volume rate for normal treatment (**Composite Clean** is a low suds action, deep penetrating conditioner treatment). For stronger preparation solutions refer to the label or data sheet.
2. Once the **Composite Clean** is applied to the deck or cladding, scrub the surface with a stiff bristle broom or mechanical scrubber on larger decks and wash off after approximately **3 / 5** minutes with clean water. Use a squeegee to remove any excess water from the deck as this will also aid in the drying time.
3. Allow the surface to dry

Weathered Wood Plastic Composite

Brushed side / Smooth side

1. Depending on the condition of the surface, this should be treated and prepared as per the steps for new Wood Plastic Composite – Cleaning Procedure, with the exception that the product may need to be treated a second time to remove all stubborn oxidization, dirt, fungus / algae, tree sap, tannins or food stains. This will be a case by case site evaluation.
2. For removal of general soiling or stains from Wood Plastic Composites surfaces we recommend that they should be treated as soon as possible with **Composite Clean** at the recommended strengths as indicated on the label. For old stubborn stains, especially BBQ oil and fat staining use **Composite Clean** at a stronger concentration. Depending on the age and degree of soiling, a re-application may be required to remove the residue of the oil / fat stain. Thoroughly rinse with water.
3. Allow the surface to dry

Application

Sealing - New Wood Plastic Composite

WPC Traction Sealer may be applied to Wood Plastic Composite decking. Wood Plastic Composites will lighten over time, surfaces may also be affected by imbedded dirt, stains, or microbial growth and therefore the method of coating should be decided on the degree of deterioration. Also, noting that the finish coating will strengthen or deepen the existing colour of the treated surfaces.

After cleaning and drying the Wood Plastic Composite as detailed above, apply **WPC Traction Sealer** as follows:

Using a 10 to 12 napp Mohair or Micro Fibre roller or brush, apply 3 coats of **WPC Traction Sealer** to the surface.

- Apply first coat to 3 full lengths of board at a time ensuring an even coating of the grit is applied. Do not push down too hard on the roller as this will cause the grit to drop out in clumps on the surface. Using the roller will impart more product on the surface and therefore might take longer to dry.
- Allow thorough drying for approximately 1-2 hours or as required depending on weather conditions/film builds and repeat a coat of sealer as detailed above, apply 3 coats to achieve optimum slip results.

Slip Rating for horizontal surfaces.

For flat surfaces around swimming pools, light foot traffic areas etc, apply **WPC Traction** premixed with fine grit to achieve P4 wet slip rating. However, extreme care should always be taken when walking on wet surfaces, especially around swimming pools. This will leave a low profile gritted finish.

Slip rating for ramps, stairs, and high foot traffic areas.

For ramps, stairs, or high foot traffic areas an addition of our Medium Grit is to be added to the **WPC Traction** product to achieve P5 wet slip rating. This will leave a more prominent surface gritted finish.

Sealing the surface will slow the effects of UV fading, and will require a recoat approx. every 12 to 18 months. As there is a slip medium added to the sealer, attention will be needed to ensure that the full slip rating is maintained. A fresh recoat may be required to areas of high traffic volume at any time.

Weathered – Wood Plastic Composite or previously treated Wood Plastic Composites requiring colour restoration

Previously coated surfaces requiring colour restoration must be stripped back to raw composite using **Deck Protect Strip (refer data sheet or label instructions)**.

Surface must then be cleaned with **Composite Clean** as illustrated under 'Cleaning Procedure' and allowed to thoroughly dry.

After the surface has been cleaned and is completely dry, apply **WPC Refresh** and **WPC Traction Sealer** as follows

Apply **WPC Refresh** thinly directly onto the surface. Ensure that the applicator, brush or rag is not over loaded, remove all excess **WPC Refresh** (this is important), and if the product pools on the surface remove to ensure an even finish. Apply to 3 full lengths of board at a time and continue to do this until completed. Depending on the weather conditions, the product will dry in approx 2 to 4 hours. To shorten drying time, back wipe the product using a second dry lambswool applicator. (Three boards at a time) Ensure that you do not walk on wet **WPC Refresh** as this will leave foot prints. If this does happen, simply rub more of the product onto the affected area and this will remove any damage, this can be done any time prior to the application of **WPC Traction Sealer**.

Once **WPC Refresh** has dried, apply 3 Coats of **WPC Traction Sealer** as outlined in 'Application'.

Aged – Wood Plastic Composite over 3 years

If no colour restoration is required: Seal as per Heading – ‘Application’ this will seal in the existing colour and protect the surface from UV degradation, dirt, water, and oil staining.

If colour restoration is required: Apply WPC Refresh and WPC Traction Sealer as per ‘Weathered - Wood Plastic Composite’ this will restore the original colour and protect the surface from UV degradation, dirt, water, and oil staining.

Maintenance

Extended exterior durability can be achieved provided substrate is protected from elements of weather and direct sunlight. Intermittent conditioning every three months with **Composite Clean** using a soft bristle broom keeping the surface free from tree sap, dirt, algal, mould or lichen growth will also extend the appearance and life of treated wood plastic composites.

The performance and durability of WPC Traction Sealer is ultimately dependent on the condition of the wood plastic composite substrate. It is therefore the discretion of the end user to ensure surfaces are kept clean as required and re-coated every 12 – 18 months. Heavy foot traffic areas exposed to direct sunlight will show obvious signs of wear quicker than shaded, light traffic areas.

When the sealed slip resistant surface starts to look weathered or worn, treat with Composite Clean and re-apply a maintenance coat of WPC Traction Sealer.

For further information on product use or product selection, please consult nearest distributor or place of purchase or refer to Deck Protect Web site at www.deckprotect.com.au

All advice, recommendations, information, or service provided by Aqualis in relation to product manufactured or supplied by it or their use and application is given in good faith and is believed by Aqualis to be appropriate and reliable. This information may be subject to change without notice. No warranty expressed or implied is made as to its accuracy, completeness or otherwise provided that the foregoing shall not exclude, limit, restrict or modify the right entitlements and remedies conferred upon any person or the liabilities imposed upon Intec by any condition or warranty implied by Commonwealth, State or Territory Act or ordinance void or prohibiting such exclusion limitation or modification. Aqualis has no control on individual customer's application methods and or raw materials used and therefore cannot be held responsible for product failure if recommended guidelines are not satisfied Products are expected to perform as indicated provided the application procedures are adhered to. The performance of this product is dependent upon correct preparation and application in accordance with the instructions on the label. This product has been tested on ModWood only, if used on any other decking or screening it will be at your own risk. Should this product be found faulty our liability is limited to the replacement of WPC Traction Sealer product only.
